# 1 Introduction

## 1.1 Purpose of the document

Product User Manuals are available for each operational H-SAF product, for open users, and also for demonstrational products, as necessary for *beta-users*.

Each PUM contains:

- Product introduction: principle of sensing, Satellites utilized, Instrument(s) description, Highlights of the algorithm, Architecture of the products generation chain, Product coverage and appearance;
- Main product operational characteristics: Horizontal resolution and sampling, Observing cycle and time sampling, Timeliness;
- Overview of the product validation activity: Validation strategy, Global statistics, Product characterisation
- Basic information on product availability: Access modes, Description of the code, Description of the file structure

An annex also provides common information on Objectives and products, Evolution of H-SAF products, User service and Guide to the Products User Manual.

Although reasonably self-standing, the PUM's rely on other documents for further details. Specifically:

- ATDD (*Algorithms Theoretical Definition Document*), for extensive details on the algorithms, only highlighted here;
- PVR (*Product Validation Report*), for full recount of the validation activity, both the evolution and the latest results.

These documents are structured as this PUM, i.e. one document for each product. They can be retrieved from the CNMCA site on HSAF web page at User Documents session.

On the same site, to obtain user and password please contact the Help Desk) it is interesting to consult, although not closely connected to this PUM, the full reporting on hydrological validation experiments (*impact studies*):

- HVR (*Hydrological Validation Report*), spread in 10 Parts, first one on requirements, tools and models, then 8, each one for one participating country, and a last Part with overall statements on the impact of H-SAF products in Hydrology.

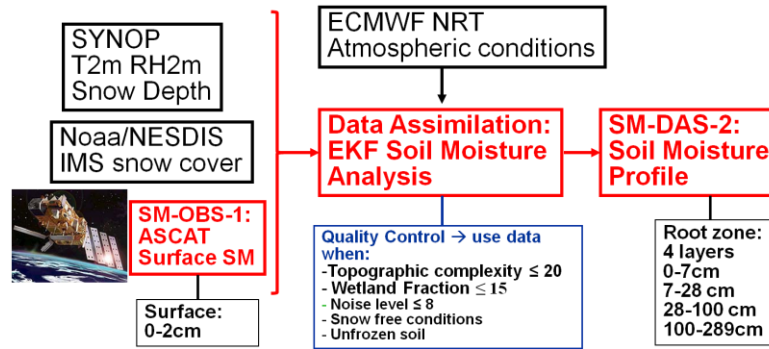

## 1.2 Introduction to product SM-DAS-2

### 1.2.1 Principle of sensing

Product SM-DAS-2 (Root zone soil moisture index in the root zone by scatterometer data assimilation) results from assimilating the SM-OBS-1 product distributed by the EUMETSAT CAF. Product SM-OBS-1 is based on the radar scatterometer ASCAT embarked on MetOp satellites. The instrument scans the scene in a push-broom mode by six side-looking antennas, three left-hand, three right-hand. On each side, the three antennas, looking aside, + 45 degrees and - 45 degrees respectively, provide three views of each earth location under different viewing angles measuring three backscattering coefficients at slightly different time. Each antenna triplet provides a side swath of 550 km. The two swaths leave a gap (close to the sub-satellite track) of ~ 670 km. Global coverage over Europe is achieved in ~ 1.5 days.

The basic instrument sampling distance is 12.5 km. The primary ASCAT observation, sea-surface wind, is processed at 50 km resolution. For soil moisture, processing is performed at 50 km (operational) and 25 km (research) resolution.

For the purpose of SM-DAS-2, the 25-km resolution SM-OBS-1 product is assimilated in the ECMWF Land Data Assimilation System (LDAS), as shown in Figure 1.

**Swath surface product SM-OBS-1 → Global Daily root zone product SM-DAS-2**

**Figure 1 SM-DAS-2 production chain based on ASCAT surface soil moisture data assimilation in the ECMWF Land Data Assimilation System**

The advanced land surface data assimilation system is in continuous development at ECMWF to retrieve root zone soil moisture profile index from ASCAT surface soil moisture index (CAF product). The SM-DAS-2 product inherits from the previous volumetric product of the development phase, SM-ASS-1. In contrast to SM-ASS-1, SM-DAS-2 is produced by a specific production chain which is being developed by ECMWF for HSAF. Its production is based on a Simplified Extended Kalman Filter (EKF). ECMWF generates SM-DAS-2 (Liquid Root zone soil moisture), thereafter ZAMG disseminates the products.

In the soil moisture assimilation system, the surface observation from ASCAT is propagated towards the roots region down to 2.89 m below surface, providing estimates for 4 layers (thicknesses 0.07, 0.21, 0.72 and 1.89 m). The ECMWF model generates soil moisture profile information according to the Hydrology Tiled ECMWF Scheme for Surface Exchanges over Land (HTESSEL) (see Figure 2).

Figure 2 Hydrology Tiled ECMWF Scheme for Surface Exchanges over Land

The assimilation scheme constrains the first guess forecast of soil moisture on any point of the Gaussian grid to be as close as possible to all observations.

In the soil moisture assimilation system, the surface observation from ASCAT is propagated towards the roots region down to 2.89 m below surface, providing estimates for 4 layers (thicknesses 0.07, 0.21, 0.72 and 1.89 m). The Land Data Assimilation System generates soil moisture profile information according to the Hydrology Tiled ECMWF Scheme for Surface Exchanges over Land (HTESSEL).

SM-DAS-2 is available at a 24-hour time step, with a global daily coverage at 00:00 UTC.

SM-DAS-1 is produced in a continuous way in order to ensure the time series consistency of the product (and also to provide values when there is no satellite data, from the model propagation). The SM-DAS-2 product is the first global product of consistent surface and root zone soil moisture available NRT for the NWP, climate and hydrological communities.

### 1.2.2 Status of satellites and instruments

The EUMETSAT Global surface soil moisture product is generated from the MetOp ASCAT. The current status of the MetOp satellite is shown in Table 1 and ASCAT characteristics are shown in Table 2.

Satellite	Launch	End of service	Height	LST	Status	Instruments used in H-SAF
MetOp-A	19 Oct 2006	expected $\geq$ 2011	817 km	09:30 d	Operational	ASCAT

Table 1 Current status of MetOP, as of January 2012

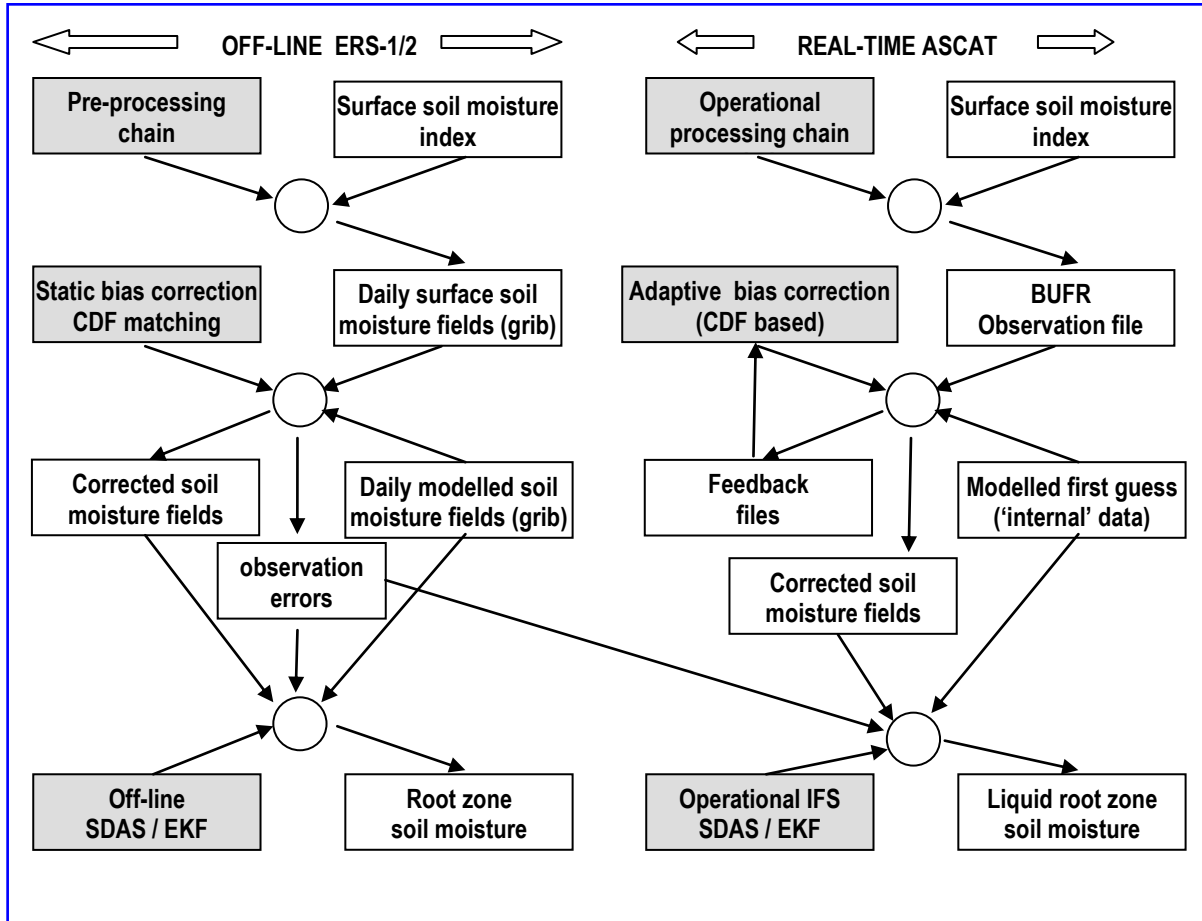

ASCAT	Advanced Scatterometer
Satellites	MetOp-A, MetOp-B, MetOp-C
Status	Operational - Utilised in the period: 2006 to ~ 2021
Mission	Sea surface wind vector. Also large-scale soil moisture
Instrument type	Radar scatterometer - C-band (5.255 GHz), side looking both left and right. 3 antennas on each side
Scanning technique	Two 550-km swaths separated by a 700-km gap along-track. 3 looks each pixel (45, 90 and 135° azimuth)
Coverage/cycle	Global coverage in 1.5 days
Resolution	Best quality: 50 km – standard quality: 25 km – basic sampling: 12.5 km
Resources	Mass: 260 kg - Power: 215 W - Data rate: 42 kbps

**Table 2 Main features of ASCAT**

### 1.2.3 Highlights of the algorithm

The baseline algorithm for SM-ASS-1 processing is described in ATBD-14. Only essential elements are highlighted here.

The liquid root zone soil moisture product to be generated at ECMWF (see flow chart in Figure 3) is the result of a data assimilation process. The input consists of the large-scale global surface soil moisture product generated at EUMETSAT ('observation'; Section 3 Product validation) and modelled root zone soil moisture ('first guess'). The output from the land surface data assimilation is a statistically optimal product conditioned by the general characteristics of the ECMWF model.

**Figure 3 Flow chart of the liquid root zone soil moisture**

To integrate the satellite based observations in the forecast system, ASCAT swath based data sets are archived in BUFR format. For developing the observation operators, daily composite soil moisture images were also archived in GRIB format.

### 1.2.4 Architecture of the products generation chain

The architecture of the SM-DAS-2 product generation chain is shown in Figure 4. The figure includes mention of the primary source of satellite data, the Global surface soil moisture product generated by EUMETSAT and disseminated via EUMETCast.

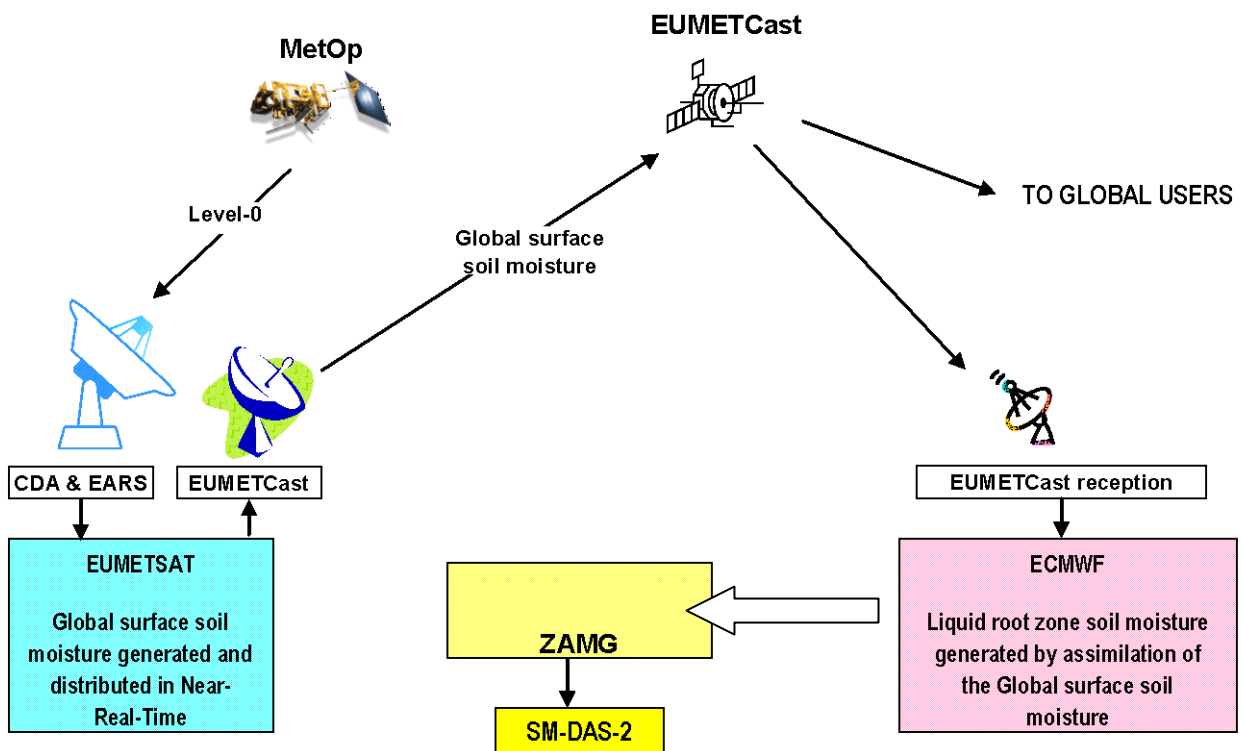

Figure 4 Conceptual architecture of SM-DAS-2 production chain

The figure shows that ECMWF produces SM-DAS-2 that is addressed to ZAMG for further dissemination in the H-SAF community.

## 2 Product operational characteristics

### 2.1 Horizontal resolution and sampling

The *horizontal resolution* ( $\Delta x$ ). The effective resolution is driven by SM-DAS-2 production chain resolution which is  $\sim 25$  km. For land surfaces processes are resolved on a discrete grid which determines the effective soil moisture product resolution. The discrete grid is a Gaussian reduced grid at T799.

Conclusion:

- horizontal resolution:  $\Delta x \sim 25$  km.

The accuracy is completed by temporal correlation against ground measurements which validates the accuracy of the product in terms of temporal variability. SM-DAS-2 is evaluated *a-posteriori* by means of the validation activity. See section 5 “Examples of SM-DAS-2 product”.

### 2.1.1 Vertical resolution if applicable

The soil moisture profile is computed for four layers: surface to 7 cm, 7 cm to 28 cm, 28 cm to 100 cm, and 100 cm to 289 cm.

### 2.1.2 Observing cycle and time sampling

The SM-DAS-2 product is produced daily at 00UTC, based on assimilation of the global CAF surface soil moisture index product (SM-OBS-1) in the ECMWF H-TESEL Land Surface Model. Although the ASCAT CAF product observing cycle over European latitudes is ~ 36 h, the assimilation process leading to the SM-DAS-2 product has its own time evolution. The product is outputted at 24-hour intervals, thus:

- observing cycle:  $\Delta t \sim 24$  h

### 2.1.3 Timeliness

For a continuous assimilation process it is difficult to identify the time lag between the observation and the product output. By considering the time needed by the model to “digest” soil moisture observation, the SM-DAS-2 timeliness will be:

- timeliness  $\delta \sim 36$  h.

### 3 Product validation

#### 3.1 Validation strategy

SM-DAS-2 root zone soil moisture profile index is validated against ground soil moisture measurements from in situ data from 15 networks across four continents (see PVR). So, for the year 2010, in situ soil moisture from 295 stations was gathered, as follow : 93 within the HSAF area in Europe [23 in France (SMOSMANIA, SMOSMANIA-E networks, Grand Morin), 21 in Spain (REMEDHUS), 9 in Germany (UDC-SMOS network), 7 in Italy (UMSUOL, CDR-Umbria, Perugia), 30 in Denmark (HOBE), 1 in Luxembourg (BIB), 1 in Finland (Maws / FMI) and 1 in Poland (SWEX POLAND)], 38 in Australia (OZNET network), 154 within the United States (NCRS-SCAN network) and 10 in Western Africa (AMMA network) are available. Next figure shows the location of the soil moisture networks used to validate SM-DAS-2.

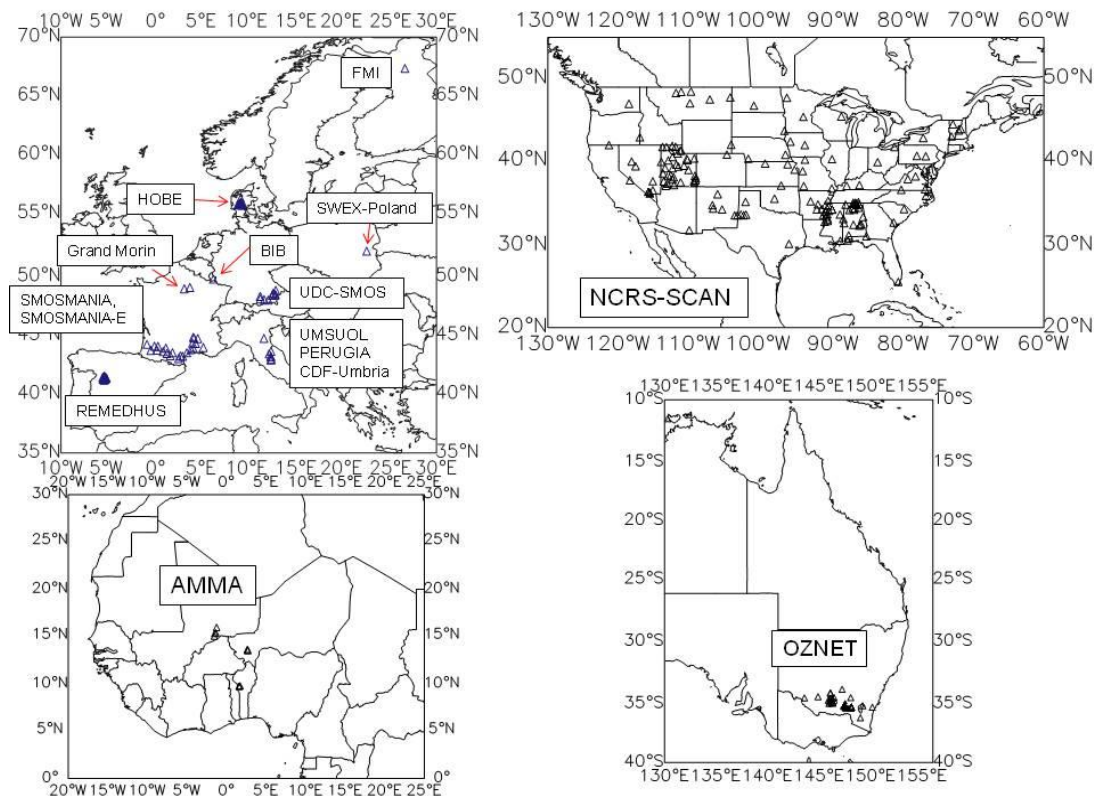

Figure 5 Location of the different in situ soil moisture stations used to validate SM-DAS-2

SM-DAS-2 is an index between 0 and 1 while in situ measurements of soil moisture are in  $m^3m^{-3}$ . To enable a fair comparison the data were rescaled. The 90% confidence interval was chosen to define the upper and lower values to exclude any abnormal outliers due to instrument noise using the following equations:

$$Int^+(insitu) = \mu(insitu) + 1.64\sigma(insitu)$$

$$Int^-(insitu) = \mu(insitu) - 1.64\sigma(insitu)$$

Where  $Int^+$  and  $Int^-$  are the upper and lower 90% limits of the confidence interval.

Then a new in situ soil moisture data set is obtained using:

$$SM = \frac{SM - Int^-}{Int^+ - Int^-}$$

It is assumed that SM-DAS-2 data set does not have such outliers problem and is rescaled using the maximum and the minimum values of each individual times series considering the whole 2010 period.

The comparison between the observation data and the H14/SM-DAS-2 product use the following statistical scores: mean bias, Standard Deviation (SD), Correlation Coefficient (CC) and Root Mean Square Difference (RMSD). In situ data contain errors (instrumental and representativeness), so they are not considered as 'true' soil moisture. This is underlined here by using the RMS Difference terminology instead of RMS Error. The correlation significance is ensured by retaining results only when the p-value is lower than 0.05 (95% confidence interval).

### 3.2 Summary of results

The statistical scores for the comparison between SM-DAS-2, and in situ SSM are presented in Table 3 for the whole 2010 period. Only the configurations associated to significant correlation values ( $p$ -value < 0.05) are considered leading to 264 stations used (over 295 available). Considering the HSAF area, 89 stations over 93 available are used. On average, for all the stations, bias, SD, RMSD ([-], [ $m^3m^{-3}$ ]) and CC are 0.049, 0.243, 0.263, 0.061  $m^3m^{-3}$  and 0.70, respectively. For 9 networks over 15, CC is higher than 0.7 which is considered as a good level of correlation (Albergel et al., 2008, 2011). Excepted the AMMA network in western Africa, all networks present RMSD value in agreement with the threshold value defined in the PRD, also reported in Table 1 (0.1  $m^3m^{-3}$ ), 10 over 15 are below the target value (0.06  $m^3m^{-3}$ ) and 2 are below the optimal value (0.04  $m^3m^{-3}$ ). If on average a value of 0.061 is found, an in depth looks to Table 3 permits to see that the stations of the AMMA network increase this value. **Considering only the stations within the HSAF area, on average, for all the stations, bias, SD, RMSD ([-], [ $m^3m^{-3}$ ]) and CC are -0.043, 0.246, 0.203, 0.047  $m^3m^{-3}$  and 0.71, respectively. The averaged RMSD value of 0.047  $m^3m^{-3}$  is below the target value of 0.06  $m^3m^{-3}$  and very close to the optimal value of 0.04  $m^3m^{-3}$ .**

Best CC values (0.88) are obtained with stations in France (Grand Morin), Luxembourg and western Africa. Lower level of CC are found in Poland and Finland (0.61 and 0.60, respectively), however, for those 2 stations, winter and late summer data are filtered due to temperature below +3°. On average, biases of -0.043 (in situ minus SSM products, dimensionless) are observed for Europe.

Country	Region (Network*)	Product acronym	Period	Bias (-)	Standard deviation (-)	RMSD (-)/[ $m^3m^{-3}$ ]	CC
France	SMOSMANIA (12 stations)	H14	2010	-0.060	0.259	0.210 / 0.056	0.79
France	SMOSMANIA-E (9 stations)	H14	2010	-0.093	0.295	0.232 / 0.071	0.76

**Table 3 Comparisons of normalised soil moisture between in situ observations and SM-DAS-2 for 2010**

In the table above, mean bias (in situ minus products), correlation, standard deviation and root mean square difference (RMSD, [-] and [m<sup>3</sup>m<sup>-3</sup>]) are given for each network and for each product. Scores are presented for significant correlations with p-values < 0.05.

## 4 Product availability

### 4.1 Site

SM-DAS-2 (h14) is available on the CNMCA FTP site, whose URL is <ftp://ftp.meteoam.it>

#### 4.1.1 Directory “products”

The data are loaded in the directory:

- *products*, for near-real-time dissemination and data holding for nominally 1-2 months, often more.

#### 4.1.2 Directory “from\_archive”

Older data are stored in the permanent H-SAF archive, and can be recovered on request. Anyway, they also are held at ECMWF. The record starts from 1<sup>st</sup> January 2010.

#### 4.1.3 Directory “utilities”

### 4.2 Formats and codes

Tow type of files are provided for SM-DAS-2:

- the digital data, coded in GRIB1;
- the image-like maps, coded in PNG.

In the directory “utilities”, the folder *Bufr\_decode* provides the instructions for reading the digital data. In addition, the output description of PR-OBS-2 is provided in [Appendix](#).

### 4.3 Description of the files

URL: <a href="ftp://ftp.meteoam.it">ftp://ftp.meteoam.it</a>	Username/password: <i>ask Help Desk</i>		directory: <i>products</i>
Product identifier: <i>h14</i>	<i>h14_cur_mon_grb</i>	digital data of current months	
Folders under <i>h14</i>	<i>H14_cur_mon_png</i>	images of current months	
Files description of current month:	<i>H14_yyyymmdd00.grib.gz</i>	digital data	
	<i>H14_yyyymmdd00.png</i>	image data	
yyymmdd: year, month, day			
L: Layer, 1 to 4 - 1: 0-7 cm; 2: 7-28 cm; 3: 28-100 cm; 4: 100-289 cm			

## Annex 1. SM-DAS-2 Output description

The SM-DAS-2 product is provided in GRIB1 format, on a [Gaussian grid](#) at the resolution T799, corresponding to N400 (~25 km).

There are several tools available to read grib files. Three applications and examples are provided to read grib files and extract data on specific location (e.g. on validation test sites).

### Use GRIB API

We recommend to use the GRIB API software to read grib files. GRIB API can be downloaded from [the ECMWF GRIB API web page](#). It needs to be used under Linux or UNIX systems.

For example if your SM-DAS-2 grib file is named h14\_2010122700.grib, the command to extract data from the four nearest grid points from latitude YLAT and longitude XLON is:

```
- grib_ls -p step,shortName -l XLAT,XLON h14_2010122700.grib
```

For any further question concerning this example or on how to read SM-DAS-2 using GRIB API, please contact [Patricia.Rosnay@ecmwf.int](mailto:Patricia.Rosnay@ecmwf.int) or [Clement.Albergel@ecmwf.int](mailto:Clement.Albergel@ecmwf.int).

### Use Metview

Metview is also recommended to be used to extract data from grib files, to plot and map data as well as to compute statistics. Metview can be downloaded and installed on Linux and Unix systems from [the ECMWF Metview web page](#).

For any further question concerning this example or on how to read or map SM-ASS-1 using Metview, please contact [Patricia.Rosnay@ecmwf.int](mailto:Patricia.Rosnay@ecmwf.int) or [Clement.Albergel@ecmwf.int](mailto:Clement.Albergel@ecmwf.int).

### Using Matlab

It is also possible to read GRIB files using Matlab, which can be used on Unix, Linux and Windows systems. Library can be downloaded from <ftp://polar.ncep.noaa.gov/pub/ofs/reference/> (also available in [read\\_grib\\_1.5.tar.gz](#)).

In the framework of the H-SAF Visiting Scientist programme, tool to read SM-DAS-2 with Matlab has been developed by Luca Brocca (Research Institute for Geo-Hydrological Protection National Research Council, Italy).

For any further question on how to read SM-DAS-1 using Matlab, please contact [luca.brocca@irpi.cnr.it](mailto:luca.brocca@irpi.cnr.it), or [Patricia.Rosnay@ecmwf.int](mailto:Patricia.Rosnay@ecmwf.int) or [Clement.Albergel@ecmwf.int](mailto:Clement.Albergel@ecmwf.int)

## Annex 2. Introduction to H-SAF

### The EUMETSAT Satellite Application Facilities

H-SAF is part of the distributed application ground segment of the “European Organisation for the Exploitation of Meteorological Satellites (EUMETSAT)”. The application ground segment consists of a “Central Application Facility (CAF)” and a network of eight “Satellite Application Facilities (SAFs)” dedicated to development and operational activities to provide satellite-derived data to support specific user communities. See next figure:

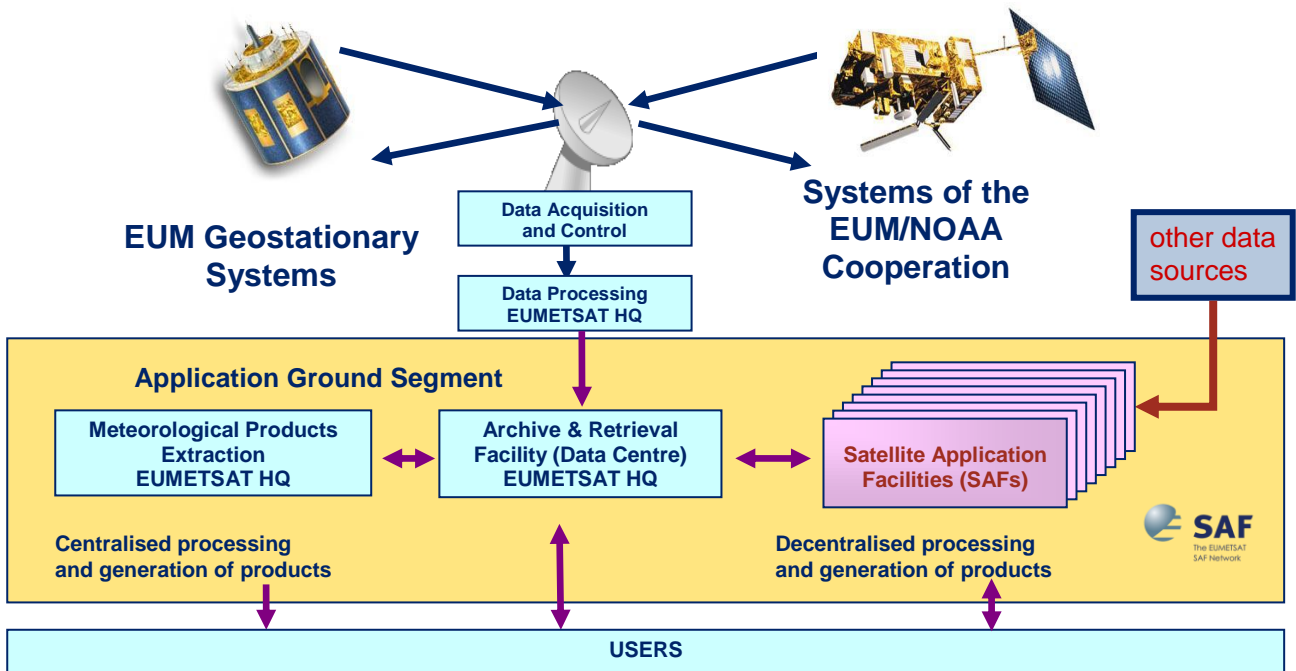

Figure 5 Conceptual scheme of the EUMETSAT Application Ground Segment

Next figure reminds the current composition of the EUMETSAT SAF network (in order of establishment).

<b>NWC SAF</b>	<b>OSI SAF</b>	<b>O3M SAF</b>	<b>CM SAF</b>	<b>NWP SAF</b>	<b>GRAS SAF</b>	<b>LSA SAF</b>	<b>H SAF</b>
Nowcasting & Very Short Range Forecasting	Ocean and Sea Ice	Ozone & Atmospheric Chemistry Monitoring	Climate Monitoring	Numerical Weather Prediction	GRAS Meteorology	Land Surface Analysis	Operational Hydrology & Water Management

Figure 6 Current composition of the EUMETSAT SAF Network (in order of establishment)

### H-SAF objectives and products

The H-SAF was established by the EUMETSAT Council on 3 July 2005; its Development Phase started on 1<sup>st</sup> September 2005 and ended on 31 August 2010. The SAF is now in its first Continuous Development and Operations Phase (CDOP) which started on 28 September 2010 and will end on 28 February 2012.

The H-SAF objectives are:

**a. to provide new satellite-derived products** from existing and future satellites with sufficient time and space resolution to satisfy the needs of operational hydrology; identified products:

- precipitation;
- soil moisture;
- snow parameters;

**b. to perform independent validation of the usefulness of the new products** for fighting against floods, landslides, avalanches, and evaluating water resources; the activity includes:

- downscaling/upscaling modelling from observed/predicted fields to basin level;
- fusion of satellite-derived measurements with data from radar and raingauge networks;
- assimilation of satellite-derived products in hydrological models;
- assessment of the impact of the new satellite-derived products on hydrological applications.

This document (the PUM, Product User Manual) is concerned only with the satellite-derived products. The list of products to be generated by H-SAF is shown in next table:

Acronym	Identifier	Name
PR-OBS-1	H-01	Precipitation rate at ground by MW conical scanners (with indication of phase)
PR-OBS-2	H-02	Precipitation rate at ground by MW cross-track scanners (with indication of phase)
PR-OBS-3	H-03	Precipitation rate at ground by GEO/IR supported by LEO/MW
PR-OBS-4	H-04	Precipitation rate at ground by LEO/MW supported by GEO/IR (with flag for phase)
PR-OBS-5	H-05	Accumulated precipitation at ground by blended MW and IR
PR-OBS-6	H-15	Blended SEVIRI Convection area/ LEO MW Convective Precipitation
PR-ASS-1	H-06	Instantaneous and accumulated precipitation at ground computed by a NWP model
SM-OBS-2	H-08	Small-scale surface soil moisture by radar scatterometer
SM-OBS-3	H-16	Large-scale surface soil moisture by radar scatterometer
SM-DAS-2	H-14	Soil Moisture Profile Index in the roots region retrieved by scatterometer assimilation method
SN-OBS-1	H-10	Snow detection (snow mask) by VIS/IR radiometry
SN-OBS-2	H-11	Snow status (dry/wet) by MW radiometry
SN-OBS-3	H-12	Effective snow cover by VIS/IR radiometry
SN-OBS-4	H-13	Snow water equivalent by MW radiometry

**Table 4 H-SAF Product List**

The work of precipitation products generation is shared in the H-SAF Consortium as follows:

- Precipitation products (pre-fix: PR) are generated in Italy by the CNMCA, in its premises at Pratica di Mare (Rome).
- CNMCA also manages the Central Archive and the Data service.

- CNR develops and upgrades the algorithm.

### Product coverage

Figure of this section shows the required geographic coverage for H-SAF products.

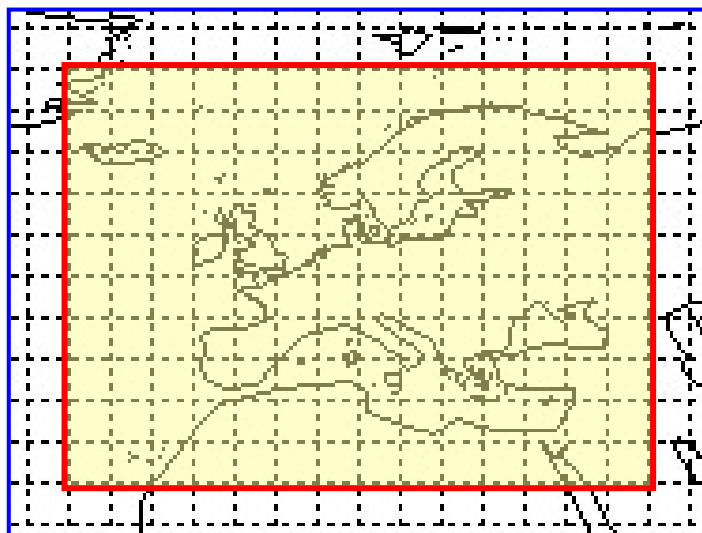

Figure 7 Required H-SAF coverage: 25-75°N lat, 25°W - 45°E

This area is fully covered by the Meteosat image (although the resolution sharply decreases at higher latitudes) each 15 min. For polar satellites, the area is covered by strips of swath approximately 1500 km (conical scanners) or 2200 km (cross-track scanners) at about 100 min intervals. Swaths intercepting the acquisition range of direct-read-out stations provide data in few minutes; for swaths outside the acquisition range the delay may be several tens of minutes if the satellite/instrument data are part of the EARS / EUMETCast broadcast, some hours otherwise (e.g., by ftp). The time resolution (*observing cycle*) is controlled by the number of satellites concurring to perform the observation, and the instrument swath.

### Data circulation and management

Next figure shows the data circulation scheme in H-SAF. All products from the generating centres are concentrated at CNMCA (except that certain can go directly to the user by dedicated links: example, GTS, Global Telecommunication System connecting operational meteorological services). From CNMCA the data are sent to EUMETSAT to be broadcast by EUMETCast in near-real-time.

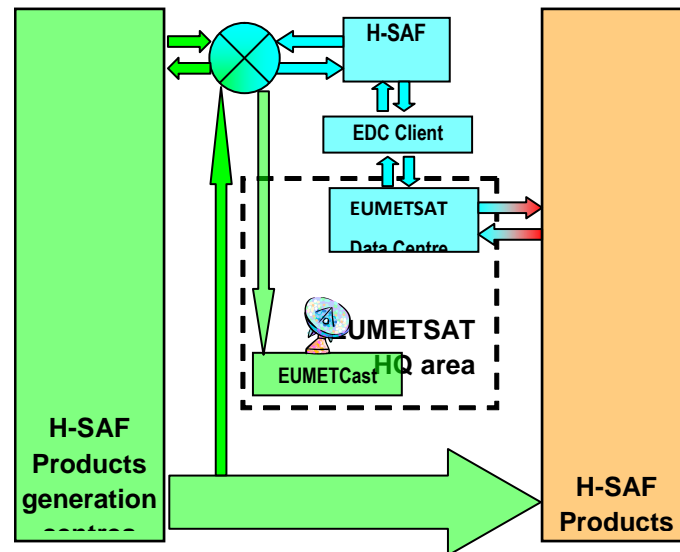

Figure 8 H-SAF central archive and distribution facilities

All data also go to the H-SAF Archive where they can be accessed through the EUMETSAT Data Centre via a Client. Therefore, the H-SAF products may be accessed:

- via EUMETCast in near-real-time (primary access mode);
- off-line via the EUMETSAT Data Centre (most common access mode for the scientific community).

It is noted that this scheme is valid only for operational products. For products in development disseminated to beta-users only, or demonstrational products, the distribution ordinarily utilises the ftp servers of the product generation centres, or the CNMCA server. CNMCA also re-disseminate the products generated in other centres, therefore all products can be retrieved from the CNMCA server.

The ftp dissemination stream will continue to be active even after the EUMETCast dissemination becomes effective, both for redundancy purpose, and for users not equipped for EUMETCast reception.

### The H-SAF web site

The address of the H-SAF web site is: <http://hsaf.meteoam.it/>.

The web site provides:

- general public information on H-SAF
- H-SAF products description
- rolling information on the H-SAF implementation status
- an area for collecting/updating information on the status of satellites and instruments used in H-SAF
- an area to collect Education and Training material
- an area for “forums” (on algorithms, on validation campaigns, etc.)
- indication of useful links (specifically with other SAF’s)
- an area for “Frequently Asked Questions” (FAQ) to alleviate the load on the Help desk.

The web site supports operations by providing:

- daily schedule of H-SAF product distribution
- administrative messages on changes of product version (new algorithms, etc.).

The web site contains some basic H-SAF documents (the ATDD, Algorithms Theoretical Definition Document; this Product User Manual, ...). However, most working documents (REP-3: Report of the Products Validation Programme; REP-4: Report of the Hydrological Validation Programme; etc.), programmatic documents (PP: Project Plan; URD: User Requirements Documents; etc.) and engineering documents are to be found in the CNMCA ftp server (restricted access; see later for the URL).

### The User Support

For any question that cannot be solved by consulting the web site, users have two different possibilities:

- To send an email through the “Contact Us” functionality of the web-site, in charge of forwarding the request to an help desk. This functionality is also available to unregistered users ;
- To compose a specific question/request to the help-desk available only to registered users; in this case, the user should specify in the “Subject” one of the following codes:
  - MAN (management)
  - PRE (precipitation)
  - SMO (soil moisture)
  - SNO (snow)
  - HYD (hydrology)
  - ARC (archive)
  - GEN (general).

### Condition for use of H-SAF products

All H-SAF products are owned by EUMETSAT, and the EUMETSAT SAF Data Policy applies. They are available for all users free of charge.

Users should recognise the respective roles of EUMETSAT, the H-SAF Leading Entity and the H-SAF Consortium when publishing results that are based on H-SAF products. EUMETSAT’s ownership of and intellectual property rights into the SAF data and products is best safeguarded by simply displaying the words “© EUMETSAT” under each of the SAF data and products shown in a publication or website.

## Annex 3. Acronyms

AMSU	Advanced Microwave Sounding Unit (on NOAA and MetOp)
AMSU-A	Advanced Microwave Sounding Unit - A (on NOAA and MetOp)
AMSU-B	Advanced Microwave Sounding Unit - B (on NOAA up to 17)
ATDD	Algorithms Theoretical Definition Document
AU	Anadolu University (in Turkey)
BfG	Bundesanstalt für Gewässerkunde (in Germany)
CAF	Central Application Facility (of EUMETSAT)
CDOP	Continuous Development-Operations Phase
CESBIO	Centre d'Etudes Spatiales de la BIOSphere (of CNRS, in France)
CM-SAF	SAF on Climate Monitoring
CNMCA	Centro Nazionale di Meteorologia e Climatologia Aeronautica (in Italy)
CNR	Consiglio Nazionale delle Ricerche (of Italy)
CNRS	Centre Nationale de la Recherche Scientifique (of France)
DMSF	Defense Meteorological Satellite Program
DPC	Dipartimento Protezione Civile (of Italy)
EARS	EUMETSAT Advanced Retransmission Service
ECMWF	European Centre for Medium-range Weather Forecasts
EDC	EUMETSAT Data Centre, previously known as U-MARF

EUM	Short for EUMETSAT
EUMETCast	EUMETSAT's Broadcast System for Environmental Data
EUMETSAT	European Organisation for the Exploitation of Meteorological Satellites
FMI	Finnish Meteorological Institute
FTP	File Transfer Protocol
GEO	Geostationary Earth Orbit
GRAS-SAF	SAF on GRAS Meteorology
HDF	Hierarchical Data Format
HRV	High Resolution Visible (one SEVIRI channel)
H-SAF	SAF on Support to Operational Hydrology and Water Management
IDL <sup>®</sup>	Interactive Data Language
IFOV	Instantaneous Field Of View
IMWM	Institute of Meteorology and Water Management (in Poland)
IPF	Institut für Photogrammetrie und Fernerkundung (of TU-Wien, in Austria)
IPWG	International Precipitation Working Group
IR	Infra Red
IRM	Institut Royal Météorologique (of Belgium) (alternative of RMI)
ISAC	Istituto di Scienze dell'Atmosfera e del Clima (of CNR, Italy)
ITU	İstanbul Technical University (in Turkey)
LATMOS	Laboratoire Atmosphères, Milieux, Observations Spatiales (of CNRS, in France)
LEO	Low Earth Orbit
LSA-SAF	SAF on Land Surface Analysis
LST	Local Satellite Time (if referred to time) or Land Surface Temperature (if referred to temperature)
Météo France	National Meteorological Service of France
METU	Middle East Technical University (in Turkey)
MHS	Microwave Humidity Sounder (on NOAA 18 and 19, and on MetOp)
MSG	Meteosat Second Generation (Meteosat 8, 9, 10, 11)
MVIRI	Meteosat Visible and Infra Red Imager (on Meteosat up to 7)
MW	Micro Wave
NET	Net Radiation
NESDIS	National Environmental Satellite, Data and Information Services
NMA	National Meteorological Administration (of Romania)
NOAA	National Oceanic and Atmospheric Administration (Agency and satellite)
NWC-SAF	SAF in support to Nowcasting & Very Short Range Forecasting
NWP	Numerical Weather Prediction
NWP-SAF	SAF on Numerical Weather Prediction
O3M-SAF	SAF on Ozone and Atmospheric Chemistry Monitoring
OMSZ	Hungarian Meteorological Service
ORR	Operations Readiness Review
OSI-SAF	SAF on Ocean and Sea Ice
PDF	Probability Density Function
PEHRPP	Pilot Evaluation of High Resolution Precipitation Products
Pixel	Picture element
PMW	Passive Micro-Wave
PP	Project Plan
PR	Precipitation Radar (on TRMM)
PUM	Product User Manual
PVR	Product Validation Report
RMI	Royal Meteorological Institute (of Belgium) (alternative of IRM)
RR	Rain Rate
RU	Rapid Update
SAF	Satellite Application Facility
SEVIRI	Spinning Enhanced Visible and Infra-Red Imager (on Meteosat from 8 onwards)
SHMÚ	Slovak Hydro-Meteorological Institute
SSM/I	Special Sensor Microwave / Imager (on DMSP up to F-15)
SSMIS	Special Sensor Microwave Imager/Sounder (on DMSP starting with S-16)
SYKE	Suomen ympäristökeskus (Finnish Environment Institute)
T <sub>BB</sub>	Equivalent Blackbody Temperature (used for IR)

TKK	Teknillinen korkeakoulu (Helsinki University of Technology)
TMI	TRMM Microwave Imager (on TRMM)
TRMM	Tropical Rainfall Measuring Mission UKMO
TSMS	Turkish State Meteorological Service
TU-Wien	Technische Universität Wien (in Austria)
U-MARF	Unified Meteorological Archive and Retrieval Facility
UniFe	University of Ferrara (in Italy)
URD	User Requirements Document
UTC	Universal Coordinated Time
VIS	Visible
ZAMG	Zentralanstalt für Meteorologie und Geodynamik (of Austria)
